# Definitions and Conditions

**Specifications** represent warranted performance of a calibrated instrument that has been stored for a minimum of 2 hours within the operating temperature of 0 to 55 °C, unless otherwise stated, and after a 45 minute warm-up period. The specifications include measurement uncertainty. Data represented in this document are specifications unless otherwise noted.

**Typical (typ)** describes additional product performance information that is not covered by the product warranty. It is performance beyond specifications that 80 percent of the units exhibit with a 90 percent confidence level at room temperature (approximately 25 °C). Typical performance does not include measurement uncertainty.

**Nominal (nom)** values indicate the expected mean or average performance, or an attribute whose performance is by design, such as the 50 ohm connector. This data is not warranted and is measured at room temperature (approximately 25 °C).

**Measured (meas)** describes an attribute measured during the design phase for purposes of communicating expected performance, such as amplitude drift vs. time. This data is not warranted and is measured at room temperature (approximately 25 °C).

### Measured relative level accuracy 2000 MHz, initial power 0 dBm

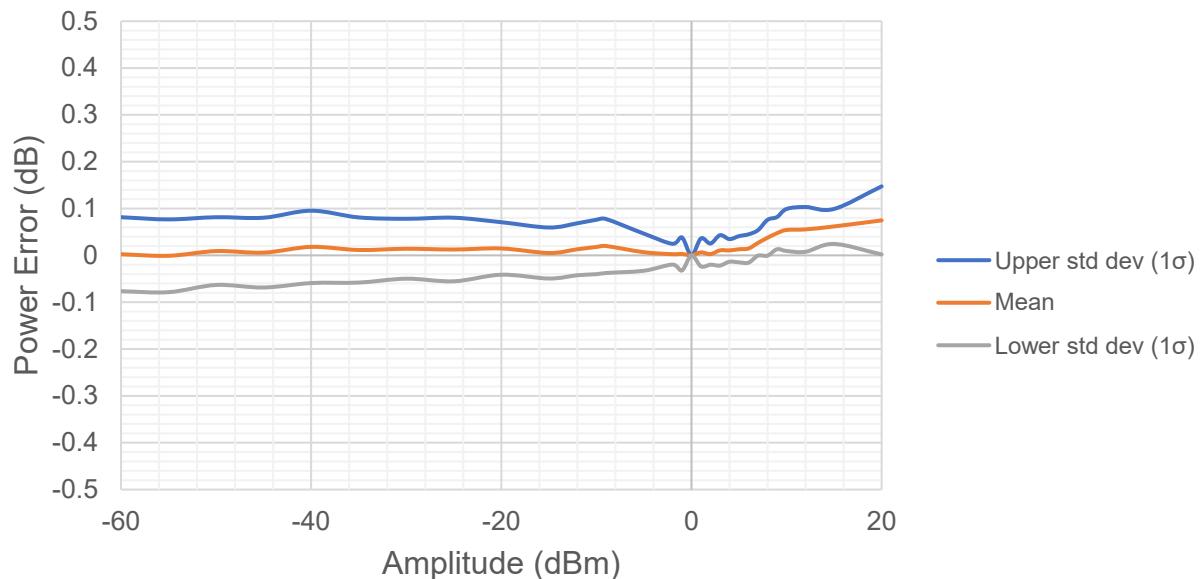

Relative level accuracy measures the accuracy of a step change from any power level to any other power level. This is useful for large changes (such as 5 dB steps).

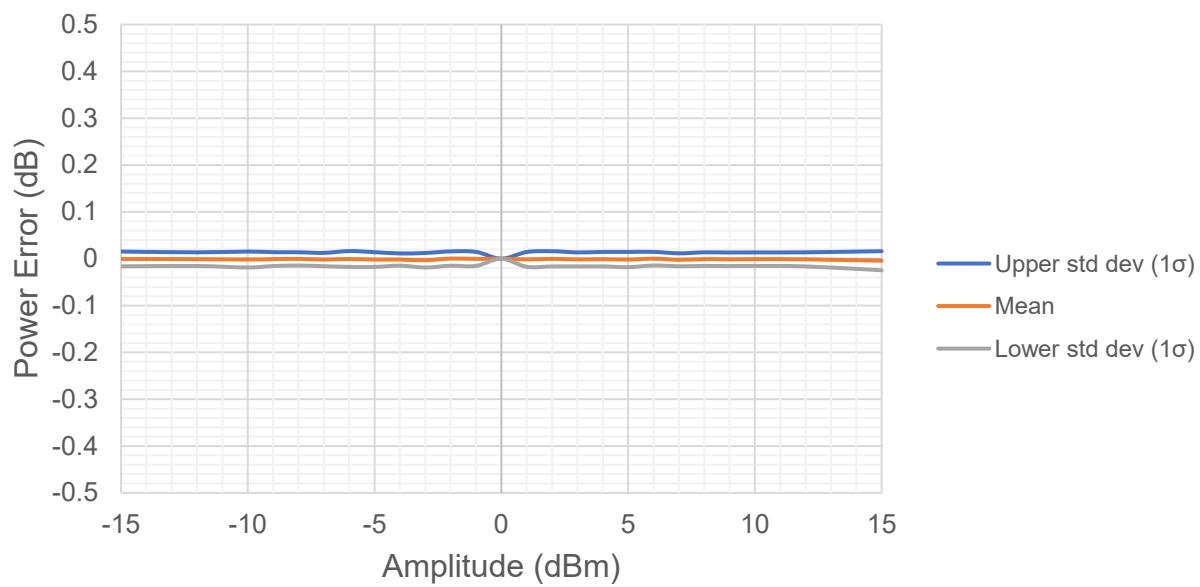

### Measured linearity 840 MHz, CW, relative to 0 dBm

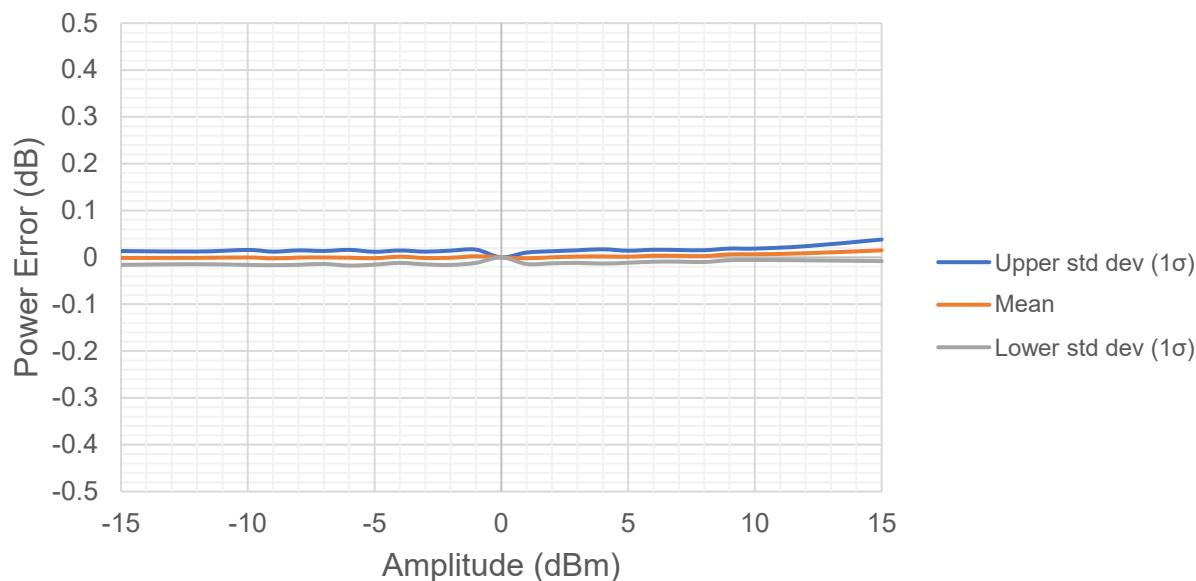

Measured linearity  
2000 MHz, CW, relative to 0 dBm

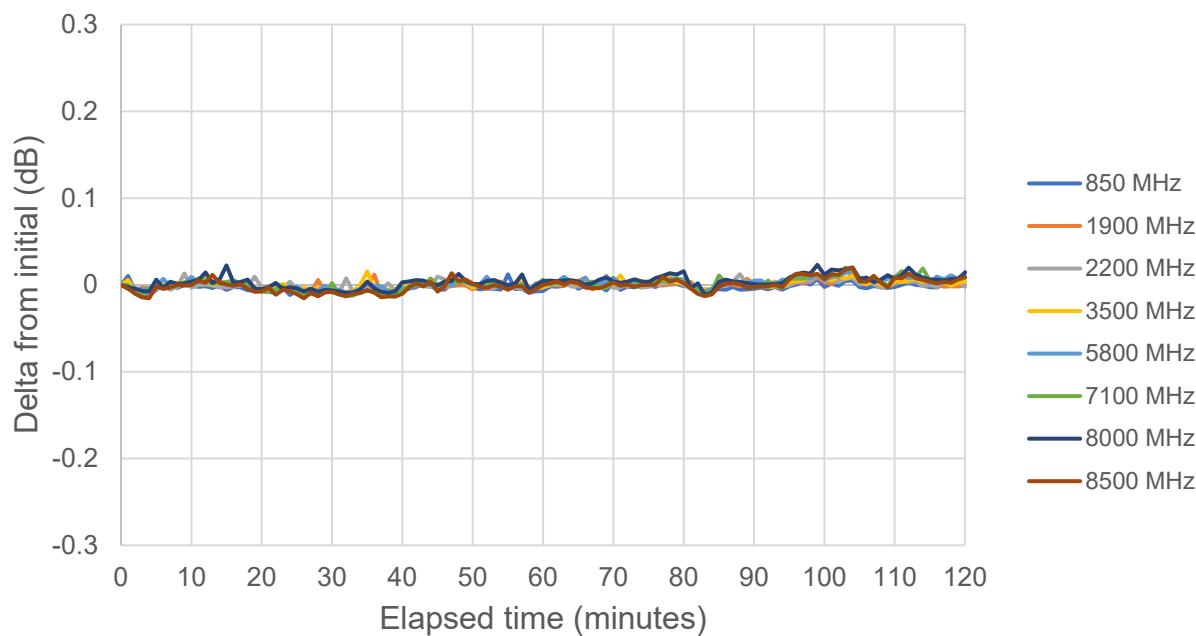

Measured linearity with all attenuator states held  
840 MHz, CW, relative to 0 dBm

Measured linearity with all attenuator states held  
2000 MHz, CW, relative to 0 dBm

Measured amplitude repeatability +5 dBm

Repeatability measures the ability of the instrument to return a given power setting after a random excursion to any other frequency and power setting. It should not be confused with absolute level accuracy.

### Simultaneous and composite modulation

| Simultaneous modulation | All modulation types (I/O, FM, AM, ΦM, and pulse modulation) may be simultaneously enabled except: FM and phase modulation cannot be combined and two modulation types cannot be simultaneously generated using the same modulation source; for example, the baseband generator, AM, and FM can run concurrently and all will modulate the output RF (this is useful for simulating signal impairments). |                           |       |          |                                  |  |
|-------------------------|--|---------------------------|-------|----------|----------------------------------|--|
| Composite modulation    | AM, FM, and ΦM each consist of two modulation paths which are summed internally for composite modulation; modulation can be any combination of internal or external sources  |                           |       |          |                                  |  |
